

AMENDMENTS TO THE ABSTRACT:

Please replace the Abstract originally appearing on page 20 of the application with the following rewritten paragraph:

ABSTRACT OF THE DISCLOSURE

The upper and lower mold plates of a transfer molding machine are configured for ~~one~~ one-side encapsulation of a pair of substrate mounted electronic devices having an opposite conductor-grid-array and/or bare heat sink/dissipater. A buffer member, optionally with cut-outs or apertures, may be placed between the two back-to-back substrates for protecting the ~~grid~~ grid-arrays and enabling encapsulation of devices with varying thicknesses without adjustment of the molding machine. Alternately, the upper and lower plates are configured for one-side encasement using covers of a pair of substrate mounted electronic devices having an opposite conductor-grid-array and/or bare heat sink/dissipater.
